# OLDER ADULTS OF COLOR EXPERIENCED WORSE HEALTH THAN OLDER WHITE ADULTS DURING THE PANDEMIC 

2020 data: Non-white adults 50+ reported worse health than older white adults 50+ due to a confluence of factors

August 2023

Rigo J. Saborio | MSG
Vice President of Programs, Equity, and Community Impact

## A Note From The SCAN Foundation Vice President of Programs, Equity, and Community Impact

COVID-19 and related challenges brought to light what many health services researchers and advocates have known for years: a series of interconnected factors contribute to communities of color having worse health care experiences-and worse health outcomes-than white communities.

Marc Cohen, PhD, and his team at the LeadingAge LTSS Center @UMass Boston and Community Catalyst confirmed this inequity in a survey analysis of 2014-2020 data showing older adults of color reported experiencing worse health during the pandemic due to a confluence of factors. They reported less telehealth use (including less access to said telehealth), more delayed care, and their care preferences not being considered.

Prior to COVID-19, racial-and wealth—disparities determined whether older adults consistently received care that respected their wishes. This trend was unchanged in 2020, when the pandemic forced most people to transition from in-person health care visits to telehealth and delay care. As this analysis demonstrates, the United States still has a long way to go to ensure its health care system serves all older adults equitably and considers their unique care preferences.

Please take a moment to review the data from the first year of the pandemic to better understand inequities in health care. This knowledge is the backbone upon which policy and operations solutions should be built.

Research bridging policy and practice

## A Note From the Research Team at The LeadingAge LTSS Center @UMass Boston and Community Catalyst

The data utilized for this study is included in the 2014-2020 Health and Retirement Study (HRS). This nationally representative panel study of adults age 50 and older in the U.S. contains longitudinal data collected biennially since 1998.

The sample for this study included those who completed the core survey from 2014-2020 and responded to the care preferences question ( $N=12,838$ ). Core COVID-19 questions were only included in the 2020 survey and were answered by 10,091 participants. A randomly selected half of the 2020 survey respondents $(4,560)$ answered an additional series of COVID-19 questions related to telehealth use and technology access.

The sample was further stratified into the following race/ethnicity groups for analyses: Non-Hispanic White ( $N=7,818$ ), Non-Hispanic Black ( $N=2,593$ ), Hispanic ( $N=1,925$ ). The HRS collapses all races/ethnicities that are not white, Black, or Hispanic into a single 'other' category. The Non-Hispanic Other category includes people who identified as Asian, American Indian, Alaskan Native, and Pacific Islander.

Due to its small sample size, the reliability of statistically significant findings was limited for the Non-Hispanic Other group ( $\mathrm{N}=502$ ). This group was used for comparison purposes in the larger analysis but was not included in the in-depth race/ ethnicity stratification analysis.

Non-Hispanic Black and Hispanic adults 50+ experienced worse health than non-Hispanic whites, regardless of whether their care preferences were considered.

## NON-HISPANIC BLACK AND HISPANIC ADULTS 50+ EXPERIENCED WORSE HEALTH

Self-Reported Health Status \& Care Preferences Considered, 2020
1 (Poor Health) - 5 (Excellent Health)

Age 50+ Reporting Care Preferences Usually/Always Considered
Age 50+ Reporting Care Preferences Sometimes/Never Considered

There were significant racial and ethnic disparities in the use of telehealth in adults 50+ during the pandemic.

## PEOPLE OF COLOR 50+ USED LESS THLEHEALTH

\% reporting they did not use telehealth, 2020

Hispanic and non-Hispanic Black adults 50+ were much more likely to delay care than non-Hispanic whites.

## PEOPLE OF COLOR WERE MORE LIKELY TO DELAY CARE

\% reporting they delayed care, 2020

NON-HISPANIC OTHER

## NON-HISPANIC BLACK AND <br> HISPANIC ADULTS 50+ WERE LESS LIKELY TO HAVE THEIR CARE PREFERENCES CONSIDERED

Researcher note: When controlling for other variables, these data represent the independent effect race/ethnicity has on preference consideration.

Major racial/ethnic disparities persist in receiving care that respects one's wishes.

Non-Hispanic Black adults 50+ have a 1.8X higher likelihood of sometimes/ never having care preferences considered than white adults 50+

Hispanic adults 50+ have a 2X higher likelihood of sometimes/never having care preferences considered than white adults 50+

## Appendix

## Respondents were asked:

Thinking about your experiences with the health care system over the past year, how often were your preferences for care taken into account, never, sometimes, usually, or always?

## 2020 Data Analysis: Race Stratification Survey Respondent Information (Combined)

*Due to small sample size, the reliability of any statistically significant findings is limited for the Non-Hispanic Other respondents and is not included in this dataset.

## Respondents were asked:

Thinking about your experiences with the health care system over the past year, how often were your preferences for care taken into account, never, sometimes, usually, or always?

## 2020 Data Analysis! Survey Respondent Information - COVID Preferences Rating Columns \& Sample

The preferences rating columns show the relationship between people who answered the question above and various social demographic characteristics. Because this is a "column analysis", it shows among the various preference categories the breakdown of socio-demographic characteristics and the proportions for a given category will sum to $100 \%$ within each preference rating. It is a different way of displaying the same relationship compared to preferences rating rows.

## Respondents were asked:

Thinking about your experiences with the health care system over the past year, how often were your preferences for care taken into account, never, sometimes, usually, or always?

## 2020 Data Analysis: Survey Respondent Information - COVID Preferences Rating Rows \& Sample

The preferences rating rows show the relationship between people who answered the question above and various social demographic characteristics. Because this is a "row analysis", it shows how the characteristic is distributed across the different preference categories and the proportions for a given demographic category will sum to $100 \%$ when viewed across the two major preference ratings. It is a different way of displaying the same relationship compared to preferences rating columns.

## Respondents were asked:

Thinking about your experiences with the health care system over the past year, how often were your preferences for care taken into account, never, sometimes, usually, or always?

## 2020 Data Analysis: Survey Respondent Information - Telehealth Preferences Rating Rows \& Sample

The preferences rating rows show the relationship between people who answered the question above and various social demographic characteristics. Because this is a "row analysis", it shows how the characteristic is distributed across the different preference categories and the proportions for a given demographic category will sum to $100 \%$ when viewed across the two major preference ratings. It is a different way of displaying the same relationship compared to preferences rating columns.

| 2020 Data Analysis: Survey Respondent Information - Telehealth Users \& Care Rating |
| :--- | :--- | :--- |
| Preferences Rating Rows |

## Respondents were asked:

Thinking about your experiences with the health care system over the past year, how often were your preferences for care taken into account, never, sometimes, usually, or always?

## 2020 Data Analysis: Survey Respondent Information - Delay of Care Preferences Rating Columns

The preferences rating columns show the relationship between people who answered the question above and various social demographic characteristics. Because this is a "column analysis", it shows among the various preference categories the breakdown of socio-demographic characteristics and the proportions for a given category will sum to $100 \%$ within each preference rating. It is a different way of displaying the same relationship compared to preferences rating rows.

## Respondents were asked:

Thinking about your experiences with the health care system over the past year, how often were your preferences for care taken into account, never, sometimes, usually, or always?

## 2020 Data Analysis: Survey Respondent Information - Delay of Care Preferences Rating Rows

The preferences rating rows show the relationship between people who answered the question above and various social demographic characteristics. Because this is a "row analysis", it shows how the characteristic is distributed across the different preference categories and the proportions for a given demographic category will sum to $100 \%$ when viewed across the two major preference ratings. It is a different way of displaying the same relationship compared to preferences rating columns.
